

Time at Home, Adjusted for Work Patterns

Change in average minutes per day at home vs. 2003, holding diary-day job-work time and location constant

Sample: American Time Use Survey respondents, civilian noninstitutionalized U.S. population ages 15 and older; one diary day per respondent, 2003-2025 (N = 245,120 with complete data). Bars: year coefficients from weighted OLS (2003 = reference) controlling for age, race/ethnicity, employment, marital status, education, own child <18, sex, home ownership, family income, month and day of week; plus diary-day job-work hours and at-home job-work hours (linear splines) and work location pattern (none/away/home/both). Error bars: 95% CIs from 160 successive-difference replicate weights. Weights: WT06 (WT20 for 2020). Time at home = activities in 'respondent's home or yard' + personal care with no recorded location (sleep, grooming, personal activities), as in Sharkey (2024). Job work = ACTIVITY 0501xx (main/other job, incl. self-employment; excludes commuting, job search). No diaries were collected Mar 18-May 9, 2020 or Sep 30-Nov 11, 2025. Source: ATUS via IPUMS ATUS.
